

"Open-Source LaTeX Collaboration Platform: A GitHub-Based Alternative to Overleaf"

This is a LaTeX-to-PDF compilation system that offers version control, source management, and completely free access for teams of any size. The platform provides an accessible, user-friendly interface for collaborative document preparation.

Acknowledgments:

- Medical Imaging Team members *Masapeta, Dhakal, Ravula, and Zhang* for their invaluable feedback, suggestions, and testing contributions
- **Amazon Q** for assistance with continuous integration debugging and configuration (anthropic sonnet model provider)
- The **corporate fat-cats at overleaf.com** whose compiler limits and stockholder demands for profits invented our need for this workaround!

The repository is archived (read: frozen in carbonite like Han Solo), but makes a perfect template for any future TeX compiler adventures—no babysitting required! Think of it as the sourdough starter of LaTeX: dormant but ready to spring into action.

Mr. Weeden's Chemistry students now have a timestamped and ready to terrorize—er, *educate*—ready-for-Friday test for his students at Shomaker High!
